Game Development Process

Pre Production

Conceptualization

Early part of the process where you make the decisions that you have to live with for the rest of the project. Such as : Selecting genre, Target user, game description, ideation

Resourcing

Any kind of physical or mental resource that can be invested to a game making process.

Engine Selection

Three of the most popular free game engines which currently are: Unreal Engine, Unity and GameMaker

Pre Production

Game Design Document

Developers and especially game designers do need documents in order to tell others about their design

Determine your role

The gaming industry has many types of jobs that become more and more specified the bigger the companies and projects are, which makes it not necessary to go through all of the roles but the roles that are most essential in terms of the case study section coming later in this thesis

Prototyping

Prototyping is a very essential part of good game design and it allows to create a working model of the conceptualized game and allows you test it feasibility easily. Game prototypes are playable, but the early prototypes only include very basic features, artwork, sound and effects

Production

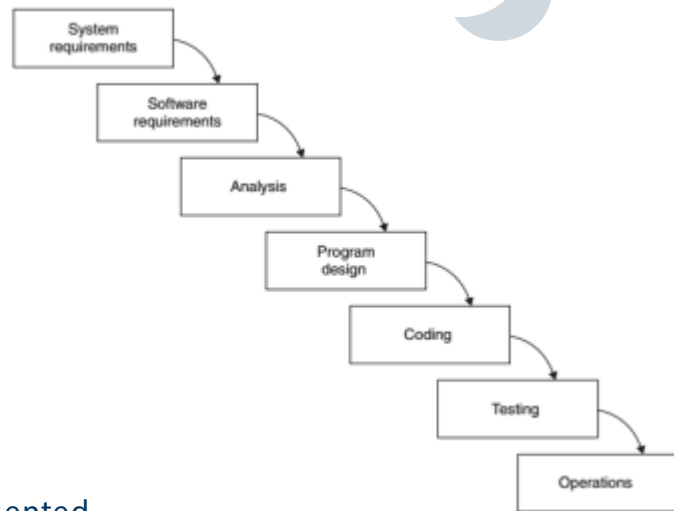

Development Methods

Development methods are crucial part of project success and also in game development and not only in regular software development where these development methods were first adopted and implemented to game development

Ending Production

Production should be planned well, but what has been presented shows that it should not be planned too tightly and room needs to be persevered for dealing with upcoming problems. Once the production is at its end, the game should have the right focus, all the necessary features locked and should be ready for final polish

Post Production

Testing

Quality assurance is a critical part of the game development and then of course the best way to test it, is to play it until it is as solid and fun as you know how to make it

Marketing

Marketing should be started as soon as possible during pre-production and then continuing throughout the project. One of the most important parts of marketing is creating a great trailer for the game

Post Release

The work never really ends even though the game has been released teams monitor the user feedback after the games release and fixes any glaring bugs that heavily affect the gameplay
