Camera

# Camera

Saat membuat sebuah scene, kita akan mendapatkan default camera

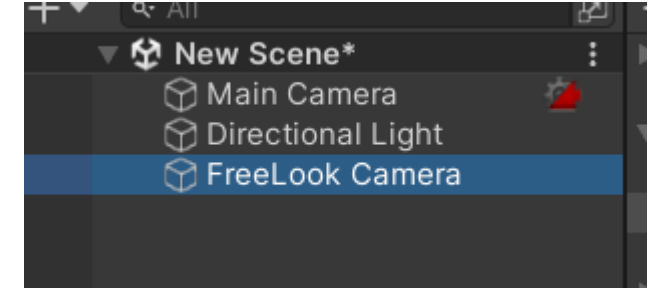

Unity memiliki berbagai package untuk camera yang disesuaikan untuk kebutuhan project yang dibuat

Default Camera

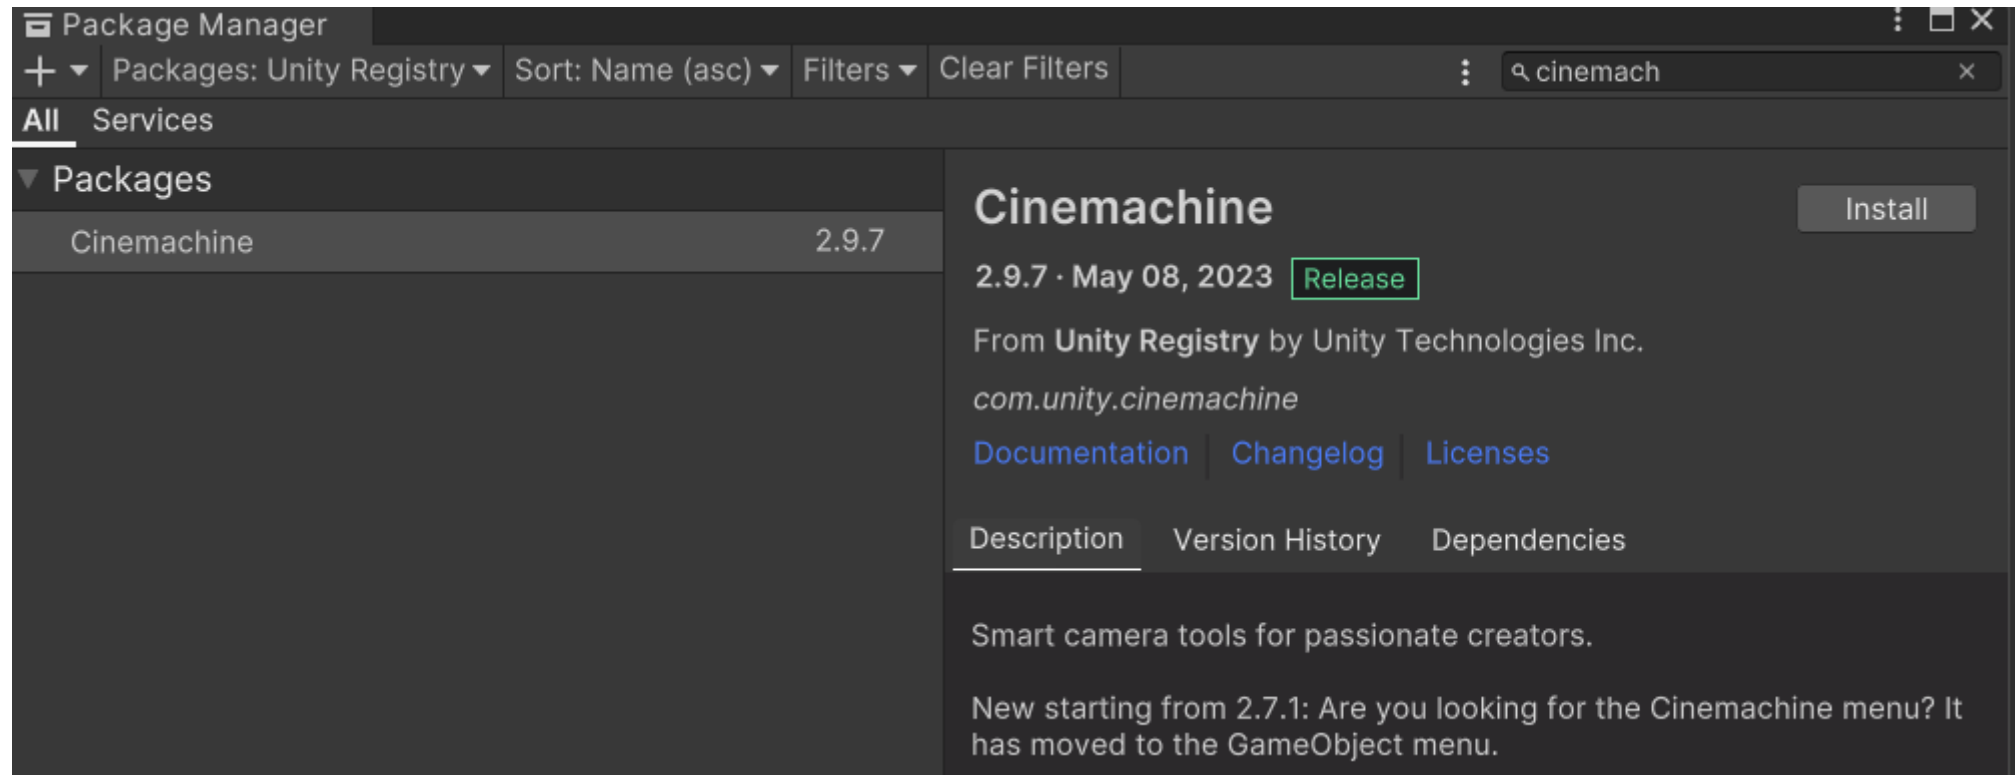

XR Rig = Kamera untuk project VR

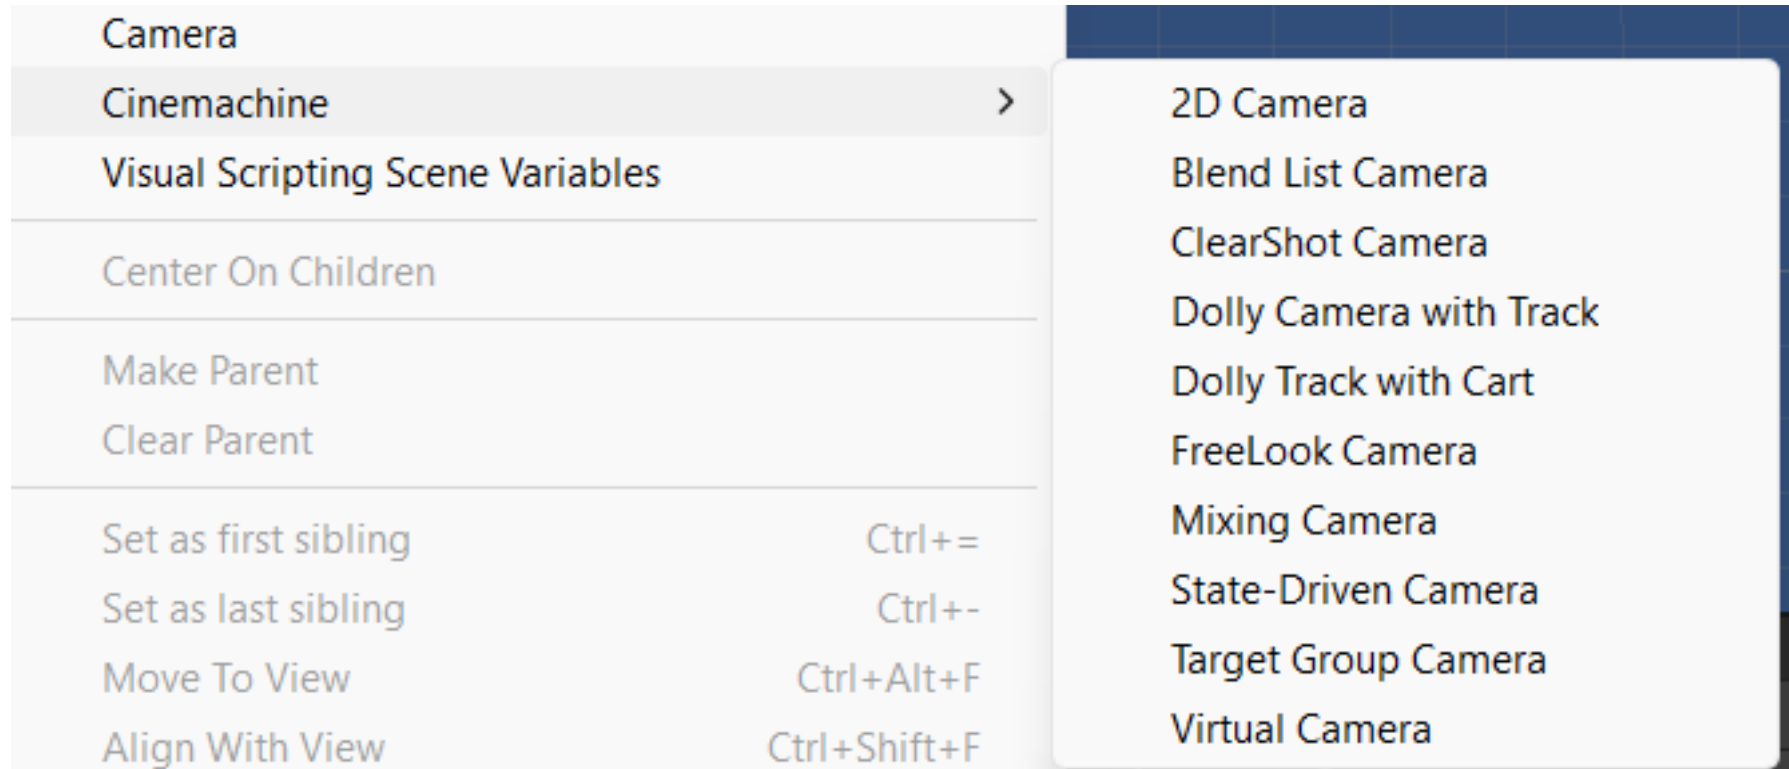

Cinemachine FreeLook Camera

# Installing Cinemachine

Cinemachine dapat diinstal melalui Package Manager (Window > Package Manager)

# Fitur pada Cinemachine

Note: Praktikum menggunakan FreeLook Camera

# Video Tentang Fitur Cinemachine

| Video                                | Description                                                                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Getting Started</a>      | Keep a camera focused on a Transform and follow it as it moves around in the Scene.                                                          |
| <a href="#">Track &amp; Dolly</a>    | Track targets by setting paths for the Cinemachine Cameras to move between.                                                                  |
| <a href="#">State Driven Cameras</a> | Link Cinemachine Cameras to animation states and further customize their behavior in the Scene.                                              |
| <a href="#">Free Look</a>            | Create an orbital camera system with input from the player and maintain control of the camera composition at different orbit stages.         |
| <a href="#">Clear Shot</a>           | Dynamically cut between Cinemachine Cameras in the Scene as a tracked target is occluded.                                                    |
| <a href="#">Post Processing</a>      | With the addition of the post-processing stack, Cinemachine allows to blend easily between different effects on the cameras or in the Scene. |
| <a href="#">Cinemachine 2D</a>       | Use Cinemachine composition tools with an orthographic virtual camera in a 2D Project.                                                       |

# Mengaktifkan Kamera

Dalam praktikum, terdapat 2 kamera FreeLook. Kamera pertama digunakan untuk movement, dan kamera kedua digunakan untuk membidik target.

Konsep yang digunakan sama dengan perpindahan panel yaitu dengan

*GameObject.SetActive(bool value)*

Tombol yang digunakan untuk case perpindahan ini nantinya adalah tombol mouse kanan.
